

INDIGO - DataCloud

Software Quality Assurance (SQA) Report

22-26 Aug 2016

ondata

SQA Progress Status **COMPLETE**

67% done

| | |
|--------------------------------|--------------------------|
| GitHub repository | COMPLETE |
| Code style adherence | IN PROGRESS - WP3 |
| Code coverage | IN PROGRESS - WP3 |
| Functional/integration testing | COMPLETE |
| GitBook documentation | COMPLETE |
| Automated deployment | COMPLETE |

Part I

Task Progress for the 1st Release

1 Repository synchronization

Products contributing to INDIGO-DataCloud project must have their code available under GitHub's `indigo-dc` organization.

Repository exists under `indigo-dc` GitHub organization:

- <https://github.com/indigo-dc/onedata>
- <https://github.com/indigo-dc/onezone>
- <https://github.com/indigo-dc/oneclient>
- <https://github.com/indigo-dc/luma>

2 Code Style

Products contributing to INDIGO-DataCloud project are expected to be adhered to a community or de-facto standard code style definition. Exceptions can be made to the selected standard. Custom style guides are

accepted but nonetheless not recommended.

| | | | |
|-----------------------------|--|----------|----------------------------------|
| Code style definition | The Dialyzer, a DIscrepancy AnaLYZer for ERlang programs | | |
| Community/de-facto standard | Yes | | |
| Exceptions | 0 | | |
| Richness | 18 | Errors 0 | Warnings 18 link |

3 Unit Testing

Code coverage will be tracked for the INDIGO-DataCloud related products and must not decrease during the project's duration. Recommended threshold is 70%.

3.1 Observations

- Command/s to check unit testing coverage have been provided, but not currently working. Need support from product team.

4 Functional/Integration testing

Functional testing must cover at least the basic functionalities that the product was requested to fulfill within the INDIGO-DataCloud project scope. Integration testing must cover the interactions with other components. Both types of testing will be automated whenever feasible by integrating them in the project's continuous integration service.

No automated execution, reports are being provided.

4.1 Reports

Functional report/s available:

- [owncloud report](#)

4.2 Observations

- Command/s to check functional testing coverage have been provided, but not currently working. Need support from product team.

5 GitBook documentation

Product-related documentation must be uploaded to GitBook's `indigo-dc` central repository. Types of documentation includes a) Developer b) Deployment and Administration c) Command-line Interface (CLI) and Application Program Interface (API) d) User Documentation. All these types may not be applied for every product. Those products that offer functionalities out of the scope of INDIGO-DataCloud project needs may not provide all the spectrum, but links to the official documentation.

Documentation available under `indigo-dc` GitBook organization:

<https://indigo-dc.gitbooks.io/onedata-documentation/content/>

5.1 Types of documentation currently provided

Readme **User documentation** **Administrator documentation**

5.2 Observations

- Points to improve in the documentation:
 - Could not find the way to install the component. For example trying to install `onezone` I followed: `Onedata for administrators > Onezone > Onezone Setup > download section`, linked to <https://onedata.org/download#/home> where I could not find any hint for installing the packages. Clicking in `get started` takes me back to GitBook.

6 Configuration Management

Those products released by INDIGO-DataCloud project that need to be deployed by the end user must rely on a maintained open-source configuration management tool to provide an automated means to install and configure the product. The recommended tool is Ansible.

6.1 Observations

- Quoting team comments:
 - When one installs `oneprovider/onezone` they really just install instance of `onepanel`. `Oneprovider/zone` are cluster (multinode) solutions. After installing `oneprovider/zone` on a number of nodes. User logs into `onepanel` on any of them, `onepanel` then detects other instances of `onepanel` running on other nodes. User uses `onepanel` to chose which services will be installed on which nodes.
 - `Onepanel` itself has no configuration variables when installed, hence the packages of `oneprovider/onezone` (and `oneclient`) has not configuration options on its own.
 - `Onedata` currently is being mainly tested and used using docker containers. We provide packages `deb/rmps` but we prefer for now that users focus on docker releases. Introducing another configuration layer on top of `onepanel/docker` containers would make the process of installing `onedata` even harder to grasp.
 - It is possible that in near future it will be possible to integrate our custom solution with ex. `Ansible`. For that reason, that task is being suspended for now.

Part II

How to read this document

1 Summary (front) page

Both the overall product's SQA adherence and per-task status codes are explained below:

COMPLETE

Task has been successfully completed and fulfills the project's SQA requirements, listed in [Deliverable D3.1](#) and [Extensions to Software Quality Assurance](#) documents.

NOT COMPLETE

Task has not been completed, yet some missing required bits have not been provided.

IN PROGRESS

Task has not been completed, but can proceed as it is.

WP3 PENDING

Task has some pending work from WP3 side, meaning that the product team already submitted the required data but it has not been yet consumed by WP3.

2 Task Progress

2.1 Code style

Code style definition

Name and link of the standard to which the product is adhered.

Community/de-facto standard

Whether the adopted standard is community-wide accepted.

Exceptions

Number of exceptions from the standard definition.

Number of rules defined in the adopted standard.

Richness

Additionally (whenever available) the **number of errors**, **number of warnings** documented in the standard will be displayed as well as the **link** to the latest definition.

2.2 Unit testing

This section will display the a) **trend graph** with the evolution of the code coverage over time and b) the **Cobertura report**, with the coverage results of different methods. Both are taken from the project's Jenkins continuous integration service.

Note: resultant coverage value is the lowest of the ones for the different methods: packages, files, classes, lines, conditionals.

2.3 Functional/Integration testing

2.4 GitBook documentation

Whenever the documentation of the product is available at the project's GitBook repository, both the a) **link** to the documentation index and b) **type of documentation** provided will be displayed in the report.

2.5 Configuration Management

Whenever the product has an recipe to be deployed automatically the following information will be available:

| | |
|-------------------------|--|
| Tool | Configuration management tool used. |
| Manifest link | URL pointing to the manifest/s. |
| Deployment level | Whether installation , configuration or both. |
| Build status | Current build status for the project's supported OS distributions. |
